Serve a Deaf customer now, without the wait.

A tablet at the counter. Your words appear as captions. Your customer answers by typing or tapping, and their reply is spoken aloud only when they confirm it.

How a counter conversation works

01
You speak normally
Your words appear on the screen as live captions.

02
They answer their way
Typing, or tapping a suggested reply.

03
They confirm
Nothing is spoken until they tap Speak.

04
You hear them
A natural voice says their reply, in under a second.

What your team does

- Open TalkMotion on a counter tablet and sign in.
- Speak normally, then wait for the reply.
- Offer the code if the customer prefers their own phone.

Staff walkthrough: about twenty minutes.

What the customer does

- Read your words as captions.
- Type, or tap a suggested reply and edit it.
- Tap Speak when it says what they mean.

Customers never pay and never install anything.

Set-up

- Any tablet or phone with a current browser.
- Wi-Fi or mobile data at the counter.
- No IT project. No software to install.
- Optional: plain-language captions for customers who prefer shorter sentences.

What it does not do

- It does not replace a qualified interpreter. For complex medical conversations, book one. TalkMotion helps with short exchanges and the wait until one arrives.
- It does not read sign language today. Customers type or tap.
- It is not a medical device and makes no clinical decisions.

Pilot program

We are running the first pilots with a small number of pharmacies. Pilot locations get pilot pricing, a staff walkthrough and priority support, and help shape what we build next. Tell us your location and how many counters you have.

talk-motion.com/contact-us
Ask about a pilot

Free for individuals. Pharmacies pay per location. Everything we claim is listed at talk-motion.com/open-build
